DARE 2 KNOW Aufklärung™

JavaScript CheatSheet Basic

Variables

`var variableName = value`

Can be reassigned and are only available inside the function they're created in. Its function scoped.

`const variableName = value`

Cannot be reassigned and not accessible before they appear within the code. Its block scoped.

`let variableName = value`

It can be reassigned but its similar to const i.e. block scoped.

If variables are not created inside a function or block they are globally scoped.

What is the block?

A block is a set of opening and closing curly brackets.

Variables

Primitive Data Types:

`Number`	5, 6.5, 7 etc
`String`	“Hello everyone” etc
`Boolean`	true or false
`Null`	represents null i.e. no value at all
`Undefined`	A variable that has not been assigned a value is undefined.
`Symbol`	used as an identifier for object properties.

Variables

Non-Primitive Data Types:

`Object`	instance through which we can access members
`Array`	group of similar values
`RegExp`	represents regular expression

Operators

Basic Operators

+	Addition
-	Subtraction
*	Multiplication
/	Division
( )	Grouping operator
%	Modulus (remainder)
++	Increment numbers
- -	Decrement numbers

Operators

Comparison Operators

`==`	Equal to
`===`	Equal value and equal type
`!=`	Not equal
`!==`	Not equal value or not equal type
`>`	Greater than
`<`	Less than
`>=`	Greater than or equal to
`<=`	Less than or equal to

Operators

Logical Operators

&&	Logical and
||	Logical or
!	Logical not

Bitwise Operators

Bitwise operators in Javascript are mostly used for numerical conversions/computations, because sometimes they're much faster than their Math or parseInt equivalents

Operators

Bitwise Operators

&	AND statement
|	OR statement
~	NOT
^	XOR
<<	Zero fill left shift
>>	Signed right shift
>>>	Zero Fill right shift

Functions

Normal Function Declaration

```
function name (parameter) {
  // statements
}
```

Function stored in a variable

```
let name = function (parameter) {
  // statements
}
```

Arrow Function

```
const name = (parameter) => {
  // statements
}
```

Conditional Statements

- Use **if** to specify a block of code to be executed, if a specified condition is true
- Use **else** to specify a block of code to be executed, if the same condition is false
- Use **else if** to specify a new condition to test, if the first condition is false
- Use **switch** to specify many alternative blocks of code to be executed

If - Else Statements

```
if (condition) {
  // code to be executed if the
     condition is true
} else {
  // code to be executed if the
     condition is false
}
```

Conditional Statements

If - Else If - Else Statements

```
if (condition1) {
   // code to be executed if the
      condition is true

} else if (condition2) {
   // code to be executed if the
      condition1 is false and
      condition2 is true

} else {
   // code to be executed if
      condition1 is false and
      condition2 is false
}
```

Conditional Statements

Switch Statement

```
switch(expression) {
  case x:
    // code block
    break;
  case y:
    // code block
    break;
  default:
    // code block
}
```

- The switch expression is evaluated once.
- The value of the expression is compared with the values of each case.
- If there is a match, the associated block of code is executed.
- If there is no match, the default code block is executed.

Conditional Statements

Ternary Operator

```
condition ? exprIfTrue : exprIfFalse
```

`condition`

An expression whose value is used as a condition.

`exprIfTrue`

An expression which is executed if the condition is truthy.

`exprIfFalse`

An expression which is executed if the condition is falsy.

Truthy / Falsy Values

FALSY Values

- false
- 0 (zero)
- "", '', `` (empty strings)
- null
- undefined
- NaN (not a number)

Note : Empty array ([]) is not falsy

TRUTHY Values

- Everything that is not FALSY

Strings

```
let variableName = “Hello world”
```

Escape Characters

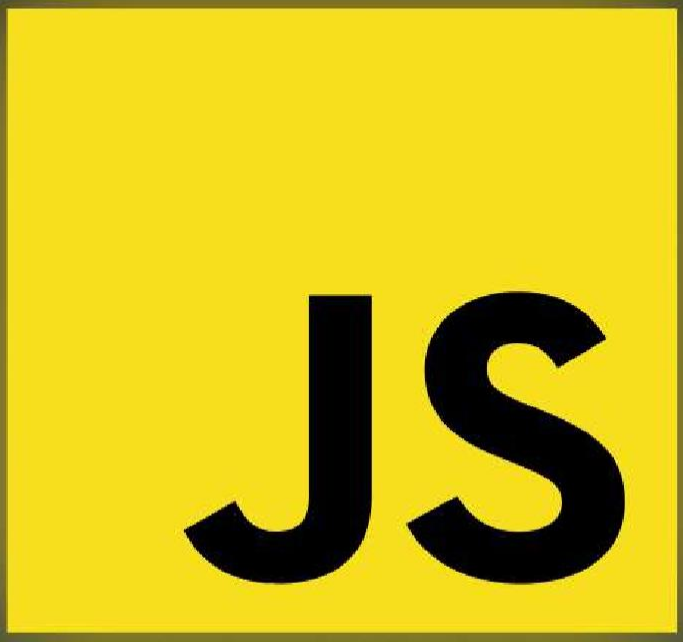

`\'`	Single quote
`\"`	Double quote
`\\`	Backslash
`\b`	Backspace
`\f`	Form feed
`\n`	New line
`\r`	Carriage return
`\t`	Horizontal tabulator
`\v`	Vertical Tabulator

RINOR

DARE 2 KNOW Aufklärung™

JavaScript CheatSheet

- String Methods
- Array Methods

String Methods

`string[index]`

get a certain character of a string

`string.length`

return the number of characters in a string

`string.split(' ')`

returns an array of words of a string

`string.split('')`

returns an array of characters of a string

`string.toLowerCase()`

returns a lowercased string

`string.toUpperCase()`

returns an uppercased string

String Methods

`string.charAt(index)`

returns a new string consisting of the single character located at the specified offset into the string.

`string.replace(substr, newSubstr)`

returns a new string with a substring (substr) replaced by a new one (newSubstr).

`string.includes(searchString)`

performs a case-sensitive search to determine whether one string may be found within another string, returns true or false.

`string.substr(start, length)`

returns a portion of the string, starting at the specified index and extending for a given number.

String Methods

`string.includes('subtring')`

checks whether a substring exists inside of a string [check the character case]

`string.indexOf(searchValue)`

returns the index of the first occurrence of the specified value, starting the search at fromIndex. Returns -1 if the value is not found.

`string.lastIndexOf(searchValue)`

returns the index of the last occurrence of the specified value, searching backwards from fromIndex. Returns -1 if the value is not found.

`string.slice(beginIndex, endIndex)`

extracts a section of a string and returns it as a new string, without modifying the original string.

Array Methods

`array[index]`

returns a certain value from an array

`push(value)`

adds the value to the end of the array

`pop()`

removes the value from the end of the array

`shift()`

removes the value from the start of the array

`unshift(value)`

adds the value to the start of the array

`splice(fromIndex, no_of_elements)`

removes the number_of_elements, starting from fromIndex from the array

Array Methods

`slice(fromIndex, toIndex)`

copies a certain part of the array

`concat()`

Join several arrays into one

`join('')`

returns a string of array values

`array.length`

returns the number of elements in the array

`reverse()`

reverse the order of the elements in an array

`toString()`

returns a string representing the specified array and its elements.

Array Methods

`toString()`

returns a string representing the specified array and its elements.

`includes(searchElement)`

determines whether an array includes a certain value among its entries, returning true or false as appropriate.

`sort()`

It sorts the elements of an array in place and returns the sorted array. It sorts an array alphabetically.

`indexOf(searchElement)`

returns the index of the first occurance of that value

`lastIndexOf(searchElement)`

returns the index of the last occurance of that value

Looping

For Loop

```
for (st 1; st 2; st 3) {
  // code block to be executed
}
```

st 1 is executed (one time) before the execution of the code block.

st 2 defines the condition for executing the code block.

st 3 is executed (every time) after the code block has been executed.

While Loop

```
while (condition) {
  // code block to be executed
}
```

Looping

Do While Loop

```
do {
  // code block to be executed
}
while (condition);
```

For In Loop

```
for (key in object) {
  // code block to be executed
}
```

For Of Loop

```
for (variable of iterable) {
  // code block to be executed
}
```

Array methods for looping

array.forEach()

It executes a provided function once for each array element.

```
array.forEach((element, index) => {
  // code block to be executed
})
```

array.map()

It creates a new array populated with the results of calling a provided function on every element in the calling array.

```
array.map((element, index) => {
  // code block to be executed
})
```

Array method for looping

array.filter()

It creates a new array with all elements that pass the test implemented by the provided function.

```
array.filter((element, index) => {
  // code block to be executed
})
```

array.findIndex()

It returns the index of the first element in the array that satisfies the provided testing function

```
array.findIndex((el, idx, arr) => {
  // code block to be executed
})
```

Array method for looping

array.some()

It tests whether at least one element in the array passes the test implemented by the provided function

```
array.some((el, index, array)) => {
  // code block to be executed
})
```

array.every()

It tests whether all elements in the array pass the test implemented by the provided function. It returns a Boolean value.

```
array.every((element, index) => {
  // code block to be executed
})
```

Array method for looping

array.reduce()

It runs a function on each array element to produce (reduce it to) a single value. It works from left-to-right.

```
array.reduce((prevValue,currentValue,
currentIndex, array)) => {
  // code block to be executed
})
```

array.reduceRight()

It runs a function on each array element to produce (reduce it to) a single value. It works from right-to-left.

```
array.reduceRight((accumulator,
currentValue, index, array)) => {
  // code block to be executed
})
```

VALUE VS REFERENCE

Arrays

```
const numbers = [1, 2, 3, 4]
const anotherNumbers = numbers
anotherNumbers.push(5);

console.log(numbers === anotherNumbers); // true
```

Objects

```
const person = { firstName: 'John', lastName: 'Doe' };
const anotherPerson = person;
anotherPerson.lastName = 'Smith';

console.log(person === anotherPerson); // true
```

VALUE VS REFERENCE

Cloning Array

One Level Deep

```
// Shallow cloning - One level Deep
const original = [1, 2, 3, 4];
const newOg = [...original];
newOg.push(5);

console.log(original === newOg) // false
```

VALUE VS REFERENCE

Cloning Array

Two Level Deep

```
// Deep cloning - Two level Deep
const users = [
  { name: 'John', age: 24 },
  { name: 'Victor', age: 31 },
];
const newUser = JSON.parse(JSON.stringify(users))
console.log(users === newUser) // false
```

DARE 2 KNOW Aufklärung™

JavaScript CheatSheet

- Date Methods
- Math Methods

JS

Math Object

`abs(x)`

Returns the absolute value of x

`acos(x)`

Returns the arccosine of x, in radians

`acosh(x)`

Returns the hyperbolic arccosine of x

`asin(x)`

Returns the arcsine of x, in radians

`asinh(x)`

Returns the hyperbolic arcsine of x

`atan(x)`

Returns the arctangent of x as a numeric value between -PI/2 and PI/2 radians

Math Object

`atan2(y, x)`

Returns the arctangent of the quotient of its arguments

`atanh(x)`

Returns the hyperbolic arctangent of x

`cbrt(x)`

Returns the cubic root of x

`ceil(x)`

Returns x, rounded upwards to the nearest integer

`cos(x)`

Returns the cosine of x (x is in radians)

`cosh(x)`

Returns the hyperbolic cosine of x

Math Object

`exp(x)`

Returns the value of Ex

`floor(x)`

Returns x, rounded downwards to the nearest integer

`log(x)`

Returns the natural logarithm (base E) of x

`max(x, y, z, ..., n)`

Returns the number with the highest value

`min(x, y, z, ..., n)`

Returns the number with the lowest value

`pow(x, y)`

Returns the value of x to the power of y

Math Object

`random()`

Returns a random number between 0 and 1

`round(x)`

Rounds x to the nearest integer

`sign(x)`

Returns if x is negative, null or positive (-1, 0, 1)

`sin(x)`

Returns the sine of x (x is in radians)

`sinh(x)`

Returns the square root of x

`sqrt(x)`

Returns the square root of x

Math Object

`tan(x)`

Returns the tangent of an angle

`tanh(x)`

Returns the hyperbolic tangent of a number

`trunc(x)`

Returns the integer part of a number (x)

Date Objects

Get Date Methods

`getFullYear()`

Get the year as a four digit number (yyyy)

`getMonth()`

Get the month as a number (0-11)

`getDate()`

Get the day as a number (1-31)

`getHours()`

Get the hour (0-23)

`getMinutes()`

Get the minute (0-59)

Date Objects

`getTime()`

Get the time (milliseconds since January 1, 1970)

`getDay()`

Get the weekday as a number (0-6)

`Date.now()`

Get the time. ECMAScript 5.

`getSeconds()`

Get the second (0-59)

`getMilliseconds()`

Get the millisecond (0-999)

Date Objects

UTC Date Methods

`getUTCDate()`

Same as getDate(), but returns the UTC date

`getUTCDay()`

Same as getDay(), but returns the UTC day

`getUTCFullYear()`

Same as getFullYear(), but returns the UTC year

`getUTCMonth()`

Same as getMonth(), but returns the UTC month

`getUTCHours()`

Same as getHours(), but returns the UTC hour

Date Objects

`getUTCMinutes()`

Same as getMinutes(), but returns the UTC minutes

`getUTCSeconds()`

Same as getSeconds(), but returns the UTC seconds

`getUTCMilliseconds()`

Same as getMilliseconds(), but returns the UTC milliseconds

Date Objects

Set Date Methods

`setDate()`

Set the day as a number (1-31)

`setFullYear()`

Set the year (optionally month and day)

`setMonth()`

Set the month (0-11)

`setHours()`

Set the hour (0-23)

`setMinutes()`

Set the minutes (0-59)

Date Objects

`setSeconds()`

Set the seconds (0-59)

`setMilliseconds()`

Set the milliseconds (0-999)

`setTime()`

Set the time (milliseconds since January 1, 1970)

Date Objects

`new Date()`

Creates a new date object with the current date and time

`new Date(year, month, ...)`

creates a new date object with a specified date and time

`new Date(dateString)`

creates a new date object from a date string

`new Date(milliseconds)`

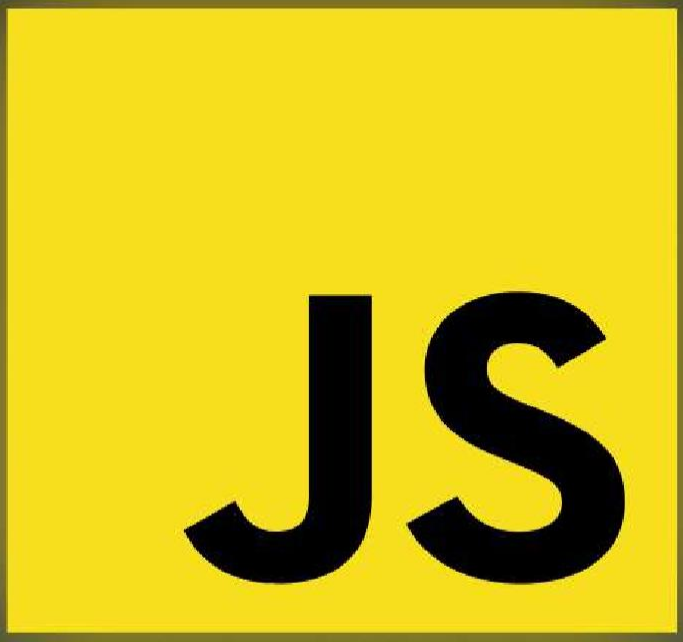

creates a new date object as zero time plus milliseconds

RINOR

DARE 2 KNOW Aufklärung™

JavaScript CheatSheet

- Window Object
- Window Methods

Window Object Methods

`alert()`

Displays an alert box with a message & an OK button

`atob()`

Decodes a base-64 encoded string

`blur()`

Removes focus from the current window

`btoa()`

Encodes a string in base-64

`clearInterval()`

Clears a timer set with setInterval()

`clearTimeout()`

Clears a timer set with setTimeout()

Window Object Methods

`close()`

Closes the current window

`confirm()`

Displays a dialog box with a message and an OK and a Cancel button

`getComputedStyle()`

Gets the current computed CSS styles applied to an element

`getSelection()`

Returns a Selection object representing the range of text selected by the user

`matchMedia()`

Returns a MediaQueryList object representing the specified CSS media query string

Window Object Methods

`focus()`

Sets focus to the current window

`moveBy()`

Moves a window relative to its current position

`moveTo()`

Moves a window to the specified position

`open()`

Opens a new browser window

`print()`

Prints the content of the current window

`prompt()`

Displays a dialog box that prompts the visitor for input

Window Object Methods

`requestAnimationFrame()`

Requests the browser to call a function to update an animation before the next repaint

`resizeBy()`

Resizes the window by the specified pixels

`resizeTo()`

Resizes the window to the specified width and height

`scrollBy()`

Scrolls the document by the number of pixels

`scrollTo()`

Scrolls the document to the specified coordinates

`stop()`

Stops the window from loading

Window Object Methods

`setInterval()`

Calls a function or evaluates an expression at specified intervals (in milliseconds)

`setTimeout()`

Calls a function or evaluates an expression after a specified number of milliseconds

Window Object Properties

`closed`

Returns a Boolean value indicating whether a window has been closed or not

`console`

Returns a reference to the Console object, which provides methods for logging information to the browser's console

`defaultStatus`

Sets or returns the default text in the statusbar of a window

`document`

Returns the Document object for the window (See Document object)

`frames`

Returns all <iframe> elements in the current window

Window Object Properties

`history`

Returns the History object for the window

`innerHeight`

Returns the height of the window's content area (viewport) including scrollbars

`innerWidth`

Returns the width of a window's content area (viewport) including scrollbars

`length`

Returns the number of <iframe> elements in the current window

`localStorage`

Allows to save key/value pairs in a web browser.

Stores the data with no expiration date

Window Object Properties

`location`

Returns the Location object for the window

`name`

Sets or returns the name of a window

`navigator`

Returns the Navigator object for the window

`opener`

Returns a reference to the window that created the window

`parent`

Returns the parent window of the current window

`self`

Returns the current window

Window Object Properties

`outerHeight`

Returns the height of the browser window, including toolbars/scrollbars

`outerWidth`

Returns the width of the browser window, including toolbars/scrollbars

`pageXOffset`

Returns the pixels the current document has been scrolled (horizontally) from the upper left corner of the window

`pageYOffset`

Returns the pixels the current document has been scrolled (vertically) from the upper left corner of the window

Window Object Properties

`screen`

Returns the Screen object for the window

`screenLeft`

Returns the horizontal coordinate of the window relative to the screen

`screenTop`

Returns the vertical coordinate of the window relative to the screen

`screenX`

Returns the horizontal coordinate of the window relative to the screen

`screenY`

Returns the vertical coordinate of the window relative to the screen

Window Object Properties

`sessionStorage`

Allows to save key/value pairs in a web browser. Stores the data for one session

`scrollX`

An alias of pageXOffset

`scrollY`

An alias of pageYOffset

`status`

Sets or returns the text in the statusbar of a window

`top`

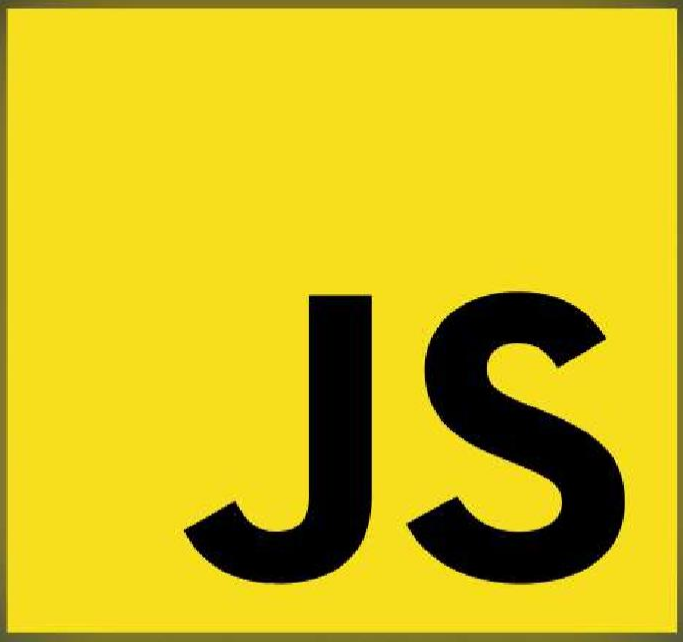

Returns the topmost browser window

RINOR

DARE 2 KNOW Aufklärung™

JavaScript CheatSheet

- DOM Events
- DOM Properties

Input Events

`onblur`

When a user leaves an input field

`onchange`

When a user changes the content of an input field

`onfocus`

When an input field gets focus

`onselect`

When input text is selected

`onsubmit`

When a user clicks the submit button

`onreset`

When a user clicks the reset button

Input Events

`onkeydown`

When a user is pressing/holding down a key

`onkeypress`

When a user is pressing/holding down a key

`onkeyup`

When the user releases a key

`onkeydown`

When the user is pressing a key

Mouse Events

`onclick`

When the user clicks on an element

`oncontextmenu`

When the user right-clicks on an element to open a context menu

`ondblclick`

When the user double-clicks on an element

`onmouseenter`

When the pointer is moved onto an element

`onmouseleave`

When the pointer is moved out of an element

`onmousemove`

when the pointer is moving while it is over an element

Mouse Events

`onmousedown`

When the user presses a mouse button over an element

`onmouseout`

When a user moves the mouse pointer out of an element, or out of one of its children

`onmouseover`

When the pointer is moved onto an element, or onto one of its children

`onmouseup`

when a user releases a mouse button over an element

HTML DOM Events

abort

The event occurs when the loading of a media is aborted

afterprint

The event occurs when a page has started printing, or if the print dialogue box has been closed

animationend

The event occurs when a CSS animation has completed

animationiteration

The event occurs when a CSS animation is repeated

animationstart

The event occurs when a CSS animation has started

HTML DOM Events

`beforeprint`

The event occurs when a page is about to be printed

`beforeunload`

The event occurs before the document is about to be unloaded

`blur`

The event occurs when an element loses focus

`canplay`

The event occurs when the browser can start playing the media (when it has buffered enough to begin)

`canplaythrough`

The event occurs when the browser can play through the media without stopping for buffering

HTML DOM Events

`change`

The event occurs when the content of a form element, or the checked state have changed

`click`

The event occurs when the user clicks on an element

`contextmenu`

The event occurs when the user right-clicks on an element to open a context menu

`copy`

The event occurs when the user copies the content of an element

`cut`

The event occurs when the user cuts the content of an element

HTML DOM Events

`dblclick`

The event occurs when the user double-clicks on an element

`drag`

The event occurs when an element is being dragged

`dragend`

The event occurs when the user has finished dragging an element

`dragenter`

The event occurs when the dragged element enters the drop target

`dragleave`

The event occurs when the dragged element leaves the drop target

HTML DOM Events

dragover

The event occurs when the dragged element is over the drop target

dragstart

The event occurs when the user starts to drag an element

drop

The event occurs when the dragged element is dropped on the drop target

durationchange

The event occurs when the duration of the media is changed

ended

The event occurs when the media has reach the end (useful for messages like "thanks for listening")

HTML DOM Events

`error`

The event occurs when an error occurs while loading an external file

`focus`

The event occurs when an element gets focus

`focusin`

The event occurs when an element is about to get focus

`focusout`

The event occurs when an element is about to lose focus

`fullscreenchange`

The event occurs when an element is displayed in fullscreen mode

HTML DOM Events

`fullscreenerror`

The event occurs when an element can not be displayed in fullscreen mode

`input`

The event occurs when an element gets user input

`invalid`

The event occurs when an element is invalid

`keydown`

The event occurs when the user is pressing a key

`keypress`

The event occurs when the user presses a key

`keyup`

The event occurs when the user releases a key

HTML DOM Events

`load`

The event occurs when an object has loaded

`loadeddata`

The event occurs when media data is loaded

`loadedmetadata`

The event occurs when meta data (like dimensions and duration) are loaded

`loadstart`

The event occurs when the browser starts looking for the specified media

`message`

The event occurs when a message is received through the event source

HTML DOM Events

`mousedown`

The event occurs when the user presses a mouse button over an element

`mouseenter`

The event occurs when the pointer is moved onto an element

`mouseleave`

The event occurs when the pointer is moved out of an element

`mousemove`

The event occurs when the pointer is moving while it is over an element

`mouseover`

The event occurs when the pointer is moved onto an element, or onto one of its children

HTML DOM Events

`mouseout`

The event occurs when a user moves the mouse pointer out of an element, or out of one of its children

`mouseup`

The event occurs when a user releases a mouse button over an element

`offline`

The event occurs when the browser starts to work offline

`online`

The event occurs when the browser starts to work online

`open`

The event occurs when a connection with the event source is opened

HTML DOM Events

`pagehide`

The event occurs when the user navigates away from a webpage

`pageshow`

The event occurs when the user navigates to a webpage

`paste`

The event occurs when the user pastes some content in an element

`pause`

The event occurs when the media is paused either by the user or programmatically

`play`

The event occurs when the media has been started or is no longer paused

HTML DOM Events

`playing`

The event occurs when the media is playing after having been paused or stopped for buffering

`popstate`

The event occurs when the window's history changes

`progress`

The event occurs when the browser is in the process of getting the media data (downloading the media)

`ratechange`

The event occurs when the playing speed of the media is changed

`resize`

The event occurs when the document view is resized

HTML DOM Events

`reset`

The event occurs when a form is reset

`scroll`

The event occurs when an element's scrollbar is being scrolled

`search`

The event occurs when the user writes something in a search field (for <input="search">)

`seeked`

The event occurs when the user is finished moving/ skipping to a new position in the media

`seeking`

The event occurs when the user starts moving/ skipping to a new position in the media

HTML DOM Events

`select`

The event occurs after the user selects some text (for <input> and <textarea>)

`show`

The event occurs when a <menu> element is shown as a context menu

`stalled`

The event occurs when the browser is trying to get media data, but data is not available

`storage`

The event occurs when a Web Storage area is updated

`submit`

The event occurs when a form is submitted

HTML DOM Events

`suspend`

The event occurs when the browser is intentionally not getting media data

`timeupdate`

The event occurs when the playing position has changed (like when the user fast forwards to a different point in the media)

`toggle`

The event occurs when the user opens or closes the <details> element

`touchcancel`

The event occurs when the touch is interrupted

`touchend`

The event occurs when a finger is removed from a touch screen

HTML DOM Events

`touchmove`

The event occurs when a finger is dragged across the screen

`touchstart`

The event occurs when a finger is placed on a touch screen

`transitionend`

The event occurs when a CSS transition has completed

`unload`

The event occurs once a page has unloaded (for <body>)

`volumechange`

The event occurs when the volume of the media has changed (includes setting the volume to "mute")

HTML DOM Events

`waiting`

The event occurs when the media has paused but is expected to resume (like when the media pauses to buffer more data)

`wheel`

The event occurs when the mouse wheel rolls up or down over an element

`hashchange`

The event occurs when there has been changes to the anchor part of a URL

HTML DOM Event Properties and Methods

`altKey`

Returns whether the "ALT" key was pressed when the mouse event was triggered

`animationName`

Returns the name of the animation

`bubbles`

Returns whether or not a specific event is a bubbling event

`button`

Returns which mouse button was pressed when the mouse event was triggered

HTML DOM Event Properties and Methods

`cancelable`

Returns whether or not an event can have its default action prevented

`charCode`

Returns the Unicode character code of the key that triggered the onkeypress event

`changeTouches`

Returns a list of all the touch objects whose state changed between the previous touch and this touch

`clientX`

Returns the horizontal coordinate of the mouse pointer, relative to the current window, when the mouse event was triggered

HTML DOM Event Properties and Methods

`clientY`

Returns the vertical coordinate of the mouse pointer, relative to the current window, when the mouse event was triggered

`clipboardData`

Returns an object containing the data affected by the clipboard operation

`code`

Returns the code of the key that triggered the event

`composed`

Returns whether the event is composed or not

`createEvent()`

Creates a new event

HTML DOM Event Properties and Methods

`ctrlKey`

Returns whether the "CTRL" key was pressed when the mouse event was triggered

`currentTarget`

Returns the element whose event listeners triggered the event

`dataTransfer`

Returns an object containing the data being dragged/dropped, or inserted/deleted

`defaultPrevented`

Returns whether or not the preventDefault() method was called for the event

HTML DOM Event Properties and Methods

`deltaX`

Returns the horizontal scroll amount of a mouse wheel (x-axis)

`deltaY`

Returns the vertical scroll amount of a mouse wheel (y-axis)

`deltaZ`

Returns the scroll amount of a mouse wheel for the z-axis

`deltaMode`

Returns a number that represents the unit of measurements for delta values (pixels, lines or pages)

HTML DOM Event Properties and Methods

`detail`

Returns a number that indicates how many times the mouse was clicked

`elapsedTime`

Returns the number of seconds an animation or transition has been running

`eventPhase`

Returns which phase of the event flow is currently being evaluated

`getTargetRanges()`

Returns an array containing target ranges that will be affected by the insertion/deletion

HTML DOM Event Properties and Methods

`getModifierState()`

Returns an array containing target ranges that will be affected by the insertion/deletion

`inputType`

Returns the type of the change (i.e "inserting" or "deleting")

`isComposing`

Returns whether the state of the event is composing or not

`isTrusted`

Returns whether or not an event is trusted

HTML DOM Event Properties and Methods

`data`

Returns the inserted characters

`key`

Returns the key value of the key represented by the event or returns the key of the changed storage item

`keyCode`

Returns the Unicode character code of the key that triggered the onkeypress event, or the Unicode key code of the key that triggered the onkeydown or onkeyup event

`location`

Returns the location of a key on the keyboard or device

HTML DOM Event Properties and Methods

`lengthComputable`

Returns whether the length of the progress can be computable or not

`loaded`

Returns how much work has been loaded

`metaKey`

Returns whether the "META" key was pressed when an event was triggered

`MovementX`

Returns the horizontal coordinate of the mouse pointer relative to the position of the last mousemove event

HTML DOM Event Properties and Methods

`MovementY`

Returns the vertical coordinate of the mouse pointer relative to the position of the last mousemove event

`newValue`

Returns the new value of the changed storage item

`newURL`

Returns the URL of the document, after the hash has been changed

`offsetX`

Returns the horizontal coordinate of the mouse pointer relative to the position of the edge of the target element

HTML DOM Event Properties and Methods

`offsetY`

Returns the vertical coordinate of the mouse pointer relative to the position of the edge of the target element

`oldValue`

Returns the old value of the changed storage item

`oldURL`

Returns the URL of the document, before the hash was changed

`onemptied`

The event occurs when something bad happens and the media file is suddenly unavailable (like unexpectedly disconnects)

HTML DOM Event Properties and Methods

`pageX`

Returns the horizontal coordinate of the mouse pointer, relative to the document, when the mouse event was triggered

`pageY`

Returns the vertical coordinate of the mouse pointer, relative to the document, when the mouse event was triggered

`persisted`

Returns whether the webpage was cached by the browser

`propertyName`

Returns the name of the CSS property associated with the animation or transition

HTML DOM Event Properties and Methods

`preventDefault()`

Cancels the event if it is cancelable, meaning that the default action that belongs to the event will not occur

`pseudoElement`

Returns the name of the pseudo-element of the animation or transition

`relatedTarget`

Returns the element related to the element that triggered the mouse event

`repeat`

Returns whether a key is being hold down repeatedly, or not

HTML DOM Event Properties and Methods

`screenX`

Returns the horizontal coordinate of the mouse pointer, relative to the screen, when an event was triggered

`screenY`

Returns the vertical coordinate of the mouse pointer, relative to the screen, when an event was triggered

`shiftKey`

Returns whether the "SHIFT" key was pressed when an event was triggered

`state`

Returns an object containing a copy of the history entries

HTML DOM Event Properties and Methods

`stopImmediatePropagation()`

Prevents other listeners of the same event from being called

`stopPropagation()`

Prevents further propagation of an event during event flow

`storageArea`

Returns an object representing the affected storage object

`target`

Returns the element that triggered the event

`total`

Returns the total amount of work that will be loaded

HTML DOM Event Properties and Methods

`targetTouches`

Returns a list of all the touch objects that are in contact with the surface and where the touchstart event occured on the same target element as the current target element

`timeStamp`

Returns the time (in milliseconds relative to the epoch) at which the event was created

`touches`

Returns a list of all the touch objects that are currently in contact with the surface

`transitionend`

The event occurs when a CSS transition has completed

HTML DOM Event Properties and Methods

`type`

Returns the name of the event

`url`

Returns the URL of the changed item's document

`which`

Returns which mouse button was pressed when the mouse event was triggered

`which`

Returns the Unicode character code of the key that triggered the onkeypress event, or onkeyup / down

`view`

Returns a reference to the Window object where the event occurred

Want to Become a JavaScript Master ?

If you're serious about learning JavaScript and getting a job as a web developer. I highly encourage you to enroll in my **Complete Path to JavaScript Mastery** Course. Don't waste your time following disconnected, outdated tutorials. My Course has everything you need in one place:
